

PRODUCT JOURNEY MAP

Kaki’s journey, first commit to demo day

WEEK 1 • 30 AUG TO 6 SEP • KAKI IS BORN

Kick-off

5 Sep: Problem domain modelling – HSS national study, user interview with Alex and Ying Wei on missed doses, bleeds and supplies

6 Sep: Birth of Kaki, the platelet mascot; multi-user support

6 Sep: Navigation: three tabs and the pages behind them

WEEK 2 • 7 TO 13 SEP • FIRST STEPS

First prototype

Features, features, and more features!

11 Sep: Medical ID, injection guide and community pages

12 Sep: Tracker v1: a month calendar of doses and refills, kept on the device

12 Sep: Profile creation with diagnosis and medication

12 Sep: Our first deployment on Vercel and Railway

Home

Tracker

Blunt Feedback, and a Wake-Up.

THE PROBLEM · WHAT WE HEARD, 13 SEP

User adoption will be a problem.

WHY — FROM OUR MENTORS

- Too cluttered with good-to-haves.
- Unclear intentions, so it is hard to use.
- Built around two people, not the wider group.

OUR RESPONSE · BACK TO USERS

We ran a survey to find out what matters to them.

HOW

- Run with the Haemophilia Society of Singapore.
- Widened the evidence beyond two voices.

WEEKS 3 AND 4 • 14 TO 26 SEP • LISTENING TO THE USERS

Ruthless Prioritization

WHAT WE KEPT

12 of 17

Prophylaxis planner

"Forgot to record... need to back track."

12 of 17

Inventory tracker

"My inventory doesn't tally with my Excel."

6 of 13

Import of prior records

trackers keep records on spreadsheets or paper

"So that I can completely switch to the app."

12 of 17

Treatment centre map

"A game changer overseas."

11 of 17

Medical ID with translation

"Translation apps may not translate medical jargon."

WEEK 4 • 21 TO 26 SEP • ONE MORE INTERVIEW

Another user interview over zoom

Home: palette and mascot

Setup: four steps to finish

Responsive, not mobile-only. The same build has to work on desktop and tablet.

The design reads feminine. Most patients are men; rework palette and mascot.

Snoozed reminders get missed. Pair the app with our hardware buzzer as an optional add-on.

Singapore formulary only. List the products actually sold here, nothing else.

Setup takes too long. Cut the four-step profile wizard down to the essentials.

Week 1
30 Aug – 6 Sep

Week 2
7 – 13 Sep

Pit stop
13 – 20 Sep

Week 3
14 – 20 Sep

Week 4
21 – 26 Sep

Demo day
26 Sep

Home tells Sam what's due, on any screen

Home on desktop: status card beside Kaki

Responsive, as users asked. One build for desktop, tablet and phone.

Status first. “Due today” with cover left and vials at home.

One tap to log. Log dose records the day and updates stock.

Week 1
30 Aug – 6 Sep

Week 2
7 – 13 Sep

Pit stop
13 – 20 Sep

Week 3
14 – 20 Sep

Week 4
21 – 26 Sep

Demo day
26 Sep

The home scene shows supply and coverage at a glance

The illustration redraws itself as the user's status changes, so no numbers or menus are needed.

SUPPLY Bottles fill and drain with remaining stock

Stocked

Running low

Empty

COVERAGE The shield holds, thins, then disappears

Protected

Unprotected

One calendar for doses, bleeds and stock

Tracker: the month at a glance

Tap a day to log a refill or dose

- Prophylaxis planner.** Planned, taken, missed and bleed days on one calendar.
- Inventory tracker.** Refills and doses update stock and set an order-by date.
- Catch up on missed logs.** Add a refill or dose to any past day.

Medical ID for travel, and setup in three questions

Full Medical ID, with language switch

New profile: three questions

- Medical ID with translation.** The full card switches language for care overseas.
- Treatment centre map.** Find the nearest haemophilia centre, at home or abroad.
- Setup in three questions.** Cut down from a four-step wizard after user feedback.

Demo day pamphlet

Transitioning to **HaemKaki** made simple with minimal setup

YOUR FRIEND WITH EVERY DOSE

Made for individuals living with **haemophilia**.
Simplifying the management of lifelong treatment.

Haemophilia is a genetic disorder that impairs normal blood clotting, leading to prolonged and potentially life-threatening bleeds.

Living with Haemophilia involves

Regular prophylactic
infusions of clotting
factor

On-demand
treatment infusion
during bleeds

Reduced freedom
in spontaneous
activity

Factor Coverage Level

Unsure about when they are adequately protected to perform daily activities

Lack of flexibility to schedule around preferences & lifestyle

Planner for Disruptions

Regional Map of Treatment Centres

Difficulty seeking Haemophilia-related medical help overseas

Quick Logging of Doses

Time-consuming to log doses

Difficult to remember large quantities of factor supply

Factor Supply Tracker

Managing orders of medication & various supplies

Order Recommendations

Unable to communicate condition overseas

Downloadable-Multilingual Medical ID

*Layout for illustrative purposes only and may differ depending on device type

Survey results

15 of 17 surveyed patients would try HaemKaki

Only 2 respondents said no, and interest held among patients who already track and those who don't.

INTEREST Respondents by answer to "Would you use HaemKaki?"

CURRENT HABITS

13 of 17

already track bleeds and factor use

11 of them track every time, so logging is an existing habit to build on.

9 of 13

trackers use Zero Bleeds

It is the only app named, and one user called it clunky and glitchy.

Tracking bleeds and doses is the top request, chosen by 15 of 17

Scheduling and travel-safety features come next; community and chatbot features rank lowest.

FEATURES Respondents who selected each proposed feature

WHAT STANDS OUT

Core logging wins

Only 2 respondents skipped tracking of factor use, bleeds and missed doses.

Travel matters

Medical help map (12) and multilingual alert ID (11) rank 2nd and 4th.

Social features trail

Forums and AI chatbot drew 8 each; export of records drew 7.

13 of 17 patients track, but 8 of them still rely on manual records

Spreadsheets, paper and memory sit alongside apps, and stock records drift when schedules change.

TRACKERS Tracking method, of 13 respondents who track

NON-TRACKERS

4 of 17

don't track bleeds or factor use

Reasons given: mild case, rare bleeds, treating only when needed.

3 of 4

were unaware of missed-dose risks

Only 1 of the 4 knew the risks of missing a prophylaxis dose.

MCP Imports

Import Zero Bleeds history in one chat with Claude

Zero Bleeds logs, as screenshots

These are my data from zerobleeds, another tracking app. Import them into haemkaki.

Two things don't line up before I write anything: the only empty profile, **zb-claude**, is set up as Factor VIII / Adynovate, while this data is Benefix (Factor IX). And haemkaki counts doses in vials, but ZeroBleeds only gives IU. Also, haemkaki records a bleed only as an on-demand dose, so the 24 Sep bleed can't go in unless a dose was actually given for it.

Which haemkaki profile should this go into? (zb-claude is empty but set as Factor VIII / Adynovate; A already has its own Tue/Fri routine and doses.)

zb-claude (Recommended)

How many vials is a 500 IU Benefix dose?

1 vial (500 IU vials)

Should I set a Wed/Sun routine starting 5 Aug? It's how haemkaki shows the 19 Aug and 9 Sep misses, and it sizes the calendar-only doses.

follow my routine from the log

Was any factor given for the 24 Sep left-elbow bleed?

No — skip it

Claude asks about what the screenshots miss

I've set the Wed + Sun routine (1 vial, from 5 Aug) on **zb-claude**, and a trial run of the import came back clean. Nothing has been written yet.

What would be added (15 rows, no conflicts):

- **12 prophylaxis doses**, 1 vial each: 5, 9, 12, 16, 23, 26, 30 Aug and 2, 6, 16, 20, 23 Sep.
- **13 Sep**: a prophylaxis dose of 2 vials (the 1,000 IU one).
- **2 make-up doses**, 1 vial each: 20 Aug covering the 19 Aug miss, and 10 Sep covering the 9 Sep miss.

What won't carry over:

- The 24 Sep bleed is left out, since no factor was given for it.
- Times of day are left out, because haemkaki logs by date.
- The "Right Hand" note on 13 Sep is left out.

Things to check:

- The doses on 5, 9 and 12 Aug and on 2 and 6 Sep only appear as coloured days on the calendar. I've assumed they were your usual 500 IU.
- The screenshots have no refill or stock count. So zb-claude will show 17 vials used against 0 on hand. Once it's in, you can add a count of what's actually on your shelf to correct that.
- The profile is still labelled Factor VIII / Adynovate. You'll want to change it to Benefix in the app.

Should I go ahead and write it?

Previewed, then written to HaemKaki over MCP

Patient's Factor IX tracker (mock data, modeled on a real patient's spreadsheet)

demo-factor-ix-t...
XLSX

excel-chatgpt — profile id 10
Upload my data to haemkaki

Worked for 33s >

I found a mismatch that needs resolving before I can prepare the import: the workbook is a **Factor IX** tracker for BeneFix, while HaemKaki **profile 10 ("excel-chatgpt")** is **Factor VIII** with Adynovate. Importing these records into that profile would mix different factors.

Which destination should I use? I can import this workbook into another HaemKaki profile if you identify the correct Factor IX profile, or you can confirm that profile 10's factor details need correcting first.

use the xlsx version

Worked for 7s

I'm already using the `.xlsx` workbook as the source. It identifies the product as BeneFix, Factor IX, while the requested destination, profile 10, is set up for Adynovate, Factor VIII. Please confirm whether profile 10's factor details are wrong and should be corrected, or give me the ID of the Factor IX profile to use.

Excel workbook; ChatGPT flags the factor mismatch

Doses land on the HaemKaki calendar

The import lands in HaemKaki as a dated dose log

1

Routine set as confirmed

Sun and Wed, 1 vial, from 5 Aug; 27 and 30 Sep planned

2

Make-up doses kept

10 Sep logged as taken, off-routine

3

Larger doses carried over

13 Sep shows 2 vials in Recent entries

4

Bleed without factor left out

24 Sep stays empty, as agreed

Reminder
